

Quantified Self App Current State:

Name: **Ashwin Hebbar**

Student email: 21f1003155@student.onlinedegree.iitm.ac.in

Sr. No.	Field	Coverage Maximum Marks(%)	
1	Project Demo	User login with login framework/forms	Completely Done
		Dashboard: Displaying list of trackers, Time stamp of last review, value on tracker	Completely Done
		Tracker Management: CRUD operations for a particular tracker Multiple language support Trend lines and stats for a tracker Logging: CRUD operations Ability to log values based on its type. Ability to update/delete a log	Tracker: CRUD Complete Multiple Languages Support enabled. Trendlines for different trackers also incorporated Logging: CRUD Complete, 5 types of values supported
2	Fundamental Operations	Overall structure of application, models, source code etc.	Structure: Similar to what's followed in the Screencasts.
3	UI	Basic UI Done, Some polishing Required still.	header/footer Added. Link to (currently Private) Github Added.

4	TO be implemented	API, Some UI polishing required to make the UX more smooth., .	Everything, except API will be definitely done before 22nd. API, I will try my best.
---	-------------------	--	---

More Details:

DB Schema (from /applications/models.py)

```

from .database import db
from flask_login import UserMixin

class User(UserMixin, db.Model):
    __tablename__ = 'user'
    id = db.Column(db.Integer, autoincrement=True, primary_key=True)
    name = db.Column(db.String, unique=True, nullable=False)
    email = db.Column(db.String)

class Tracker(db.Model):
    __tablename__ = 'tracker'
    id = db.Column(db.Integer, autoincrement=True, primary_key=True)
    userid = db.Column(db.Integer, db.ForeignKey("user.id"))
    name = db.Column(db.String, nullable=False)
    type = db.Column(db.Integer, nullable = False)
    choices = db.Column(db.String)
    details = db.Column(db.String)
    time = db.Column(db.String, nullable=False)

class Logs(db.Model):
    __tablename__ = 'logs'
    id = db.Column(db.Integer, autoincrement=True, primary_key=True)
    userid = db.Column(db.Integer, db.ForeignKey("user.id"))
    tid = db.Column(db.Integer, db.ForeignKey("tracker.id"))
    value = db.Column(db.String, nullable = False)
    data = db.Column(db.String)
    time = db.Column(db.String, nullable=False)

```

Please do have a look at the codebase. It's well structured and easy to understand.

The App should run by running main.py (no flags whatsoever required), it should also run on Replit with minimal changes to the main.py file (specifically, in the **app.run()** command)
